EDUCATION

Monterrey's Institute of Technology and Higher Education (Tecnológico de Monterrey)	Querétaro, MX
<i>Bachelor of Science in Computer Science, Minor in Cybersecurity</i>	<i>Expected: June 2027</i>
• GPA: 96.35/100 (3.9/4.0) Academic Talent Scholarship Recipient • Relevant Coursework: Data Structures & Algorithms, Object-Oriented Programming, IoT Implementation, Computational Thinking	

EXPERIENCE

Jr. Software Developer (AI)	May 2026 – Present
<i>Globalli</i>	<i>Remote</i>

Data Scientist	May 2026 – Present
<i>Satellites on Fire – Climate Tech Startup</i>	<i>Remote</i>

- Designing and building impact quantification pipeline per detected wildfire incident, modeling hectares saved, CO₂ emissions avoided, suppression costs prevented, and protected infrastructure and biodiversity
- Defining counterfactual baseline methodology (what would have occurred without early detection) by cross-referencing historical **FIRMS** data, final fire perimeters, and team fire-spread models
- Integrating multi-source emissions quantification data (**GFED**, **Copernicus CAMS**, per-biome emission factors) for scientifically grounded impact reporting
- Translating impact metrics into actionable client outputs — dashboards, periodic reports, and data exports — in close collaboration with the product team

CTO & Co-Founder	February 2025 – Present
<i>Neural Harvest – AgTech Startup</i>	<i>Querétaro, MX</i>

- Selected for **Dedalus Break In Program** residency in San Francisco, joining 20 founders from 13 countries in month-long AI startup accelerator
- Leading development of AI-powered precision agriculture platform combining satellite imagery analysis with proprietary ML crop simulation engines
- Architecting scalable microservices infrastructure processing multi-spectral satellite data with hybrid database systems and containerized deployment
- Managing cross-functional team implementing enterprise-grade RBAC, real-time IoT monitoring, and automated field communication systems

PROJECTS

START Hack - OrbitGrow Martian Greenhouse <i>Python, FastAPI, React, AWS SAM/Lambda</i>	March 2026
• Architected autonomous multi-agent AI system with 5 specialized agents (Nutrition, Environment, Crisis, Planner, Vision) orchestrated via Sol-loop coordinator to manage a Martian greenhouse sustaining 4 astronauts over a 450-day mission • Built real-time simulation engine modeling crop growth, weather drift, and crisis events across 12 greenhouse plots, with all agent decisions grounded in the Syngenta MCP Knowledge Base via streamable HTTP endpoint • Engineered full-stack platform with FastAPI backend, React digital twin dashboard, and WebSocket live updates, deployed on AWS using SAM with Lambda functions, API Gateway, and 6 DynamoDB tables	

TreeHacks - Sentinel AI Security Scanner <i>Python, Next.js, Gemini, Playwright, Supabase</i>	February 2026
• Architected autonomous penetration testing platform deploying swarm of 10 specialized AI agents for concurrent web security scanning with coordinated reconnaissance, exploitation, and analysis phases • Engineered Flask-based orchestration engine with asyncio managing concurrent agent execution across attack surface mapping, SQLi/XSS fuzzing, CORS/header auditing, and autonomous Playwright-powered Red Team agent • Built real-time Next.js 16 dashboard with Supabase Realtime event streaming, severity-weighted security scoring (A-F), and Gemini-generated remediation reports with OWASP references	

Prometheus - AI-Powered Recruitment Platform <i>Python, Flask, Next.js, Google Gemini 2.5, Firebase</i>	October 2025
• Architected conversational AI recruitment system using Gemini 2.5 Flash with ADK, implementing progressive filtering across multi-turn dialogues for semantic candidate matching beyond keyword search • Engineered full-stack platform with Flask REST API, Next.js 15, and Firebase Firestore, integrating Twilio WhatsApp API for 98% open rates vs 20% email, with CV parsing and automated job description generation • Developed semantic matching with transferable skills analysis (Vue.js → React equivalence), 0-100 compatibility scoring, reducing candidate discovery from 3-5 days to 2 minutes	

Bloomby - Wildflower Bloom Prediction Platform <i>Python, Flask, TensorFlow, Google Earth Engine</i>	October 2025
• Engineered ML platform predicting wildflower blooms using NASA satellite data (MODIS, SMAP) with 31+ ecological features including spring phenology detection, growing degree days, and soil water stress analysis • Developed Gradient Boosting classifier achieving 0.72-0.85 ROC-AUC with feature engineering combining spatial, temporal, and environmental variables across 73 years of climate data, including cherry blossom model with ±3 days accuracy • Built full-stack app with Flask REST API, Google Earth Engine integration, and interactive 3D globe visualization supporting global bloom predictions with 90-day forecasting	

TECHNICAL SKILLS

Languages: Python, C/C++, JavaScript, TypeScript, SQL/MySQL, HTML/CSS, R, MATLAB
Frameworks & Libraries: FastAPI, Flask, Next.js, React, TensorFlow, Scikit-learn, Pandas, NumPy, Node.js, Express.js
Tools & Technologies: AWS (SAM, Lambda, DynamoDB), Playwright, Supabase, Docker, GCP, Google Earth Engine, Git, PostgreSQL, Firebase
Specializations: AI Agent Systems, Penetration Testing, Cybersecurity, Machine Learning, Full-Stack Development, Real-time Systems, Web Security
